introduction

HORNE Engineering have been designing, developing and manufacturing thermostatic valves since 1909.

Over the years we have continually improved and refined thermostatic temperature control technology and its application. Our product portfolio includes a broad range of specialised thermostatic mixing valves and shower valves developed to address the needs of a variety of niche applications. Now our product range has been extended further with the production of our first thermostatic tap – the award-winning* OPTITHERM®.

*Best Interiors Product, Building Better Healthcare Awards 2008
DESIGN CONCEPT

The OPTITHERM® is a highly specialised thermostatic tap developed principally for healthcare applications. We set out to achieve a design that meets the needs of a variety of users looking for the following key features:

- ease of use
- consistent delivery of safe and comfortable hot water
- easy access for testing and maintenance
- optimised user interface - to enhance hygiene compliance
- easy cleaning for improved hygiene
- robust construction
- compliance with a range of healthcare related regulations and published guidance
- efficient use of energy and water
- minimisation of coldwater dead legs
safe hot water & surface temperatures

The consistent delivery of 'safe' hot water is an essential component in the provision of good healthcare.

SAFE HOT WATER

The Type 3 approved OPTITHERM® mixes hot and cold water immediately prior to the point of discharge and it is essential that the user does not experience transients or excursions in the temperature of the mixed water. It is normal for thermostatic mixing valves to produce transients when starting from ambient as the proportioning device in the mixing valve moves to the desired position. The highly responsive mechanism in the OPTITHERM® produces exceptional performance in this regard as shown on the above graph.

SAFE SURFACE

The OPTITHERM® should be supplied with hot water at a temperature that will typically be in the range of 55°C – 65°C, which is then mixed with cold water inside the tap to produce mixed water at a safe and comfortable level. It is essential that the temperature of the outer surface of a tap does not become dangerously high during and immediately after periods of operation. The thermal image above demonstrates how the temperature of the outer surface of the OPTITHERM® remains at a safe level during operation.

ANALYSIS

Ar1 Min 21.8°C Max 41.8°C Average 33.7°C
Sp1 41.0°C
Fixtures and fittings used by healthcare staff and patients should be designed wherever possible to contribute to enhanced infection control and perform in a manner that is conducive to maintaining excellent levels of hygiene.

**USER OPERATION**

The manner in which the user makes physical contact with the tap when opening and closing the flow is recognised as a particularly important feature of a hospital tap. Our unique double lever option allows for the lever to be pushed on using a single thumb (A) but, crucially, after hand washing, the elbow or upper forearm is used, again in a pushing forward movement (B), to close the flow keeping the hands away from the face and hair. Wherever possible we have made the user interface as easy and intuitive as possible. An integral flow regulator and laminar flow conditioner ensures that water is delivered in a controlled manner (6 l/m) as opposed to a splashing surge, which again gives a more user friendly result, that is conducive to good hand washing practice.

**EASE OF CLEANING**

The OPTITHERM® has been designed to ensure that all areas of the outer surface of the product are highly accessible for easy and effective cleaning. There are also no parts that can be prised off leaving recesses, which can harbour dirt and pathogens.

We recommend a single-use cleaning cloth be used to clean the Optitherm tap and a separate, single-use cloth for cleaning the basin.
**Installation & Commissioning**

A complete and effective commissioning procedure will help to ensure the correct operation of the hot and cold water systems.

**Installation**

Installation of the OPTITHERM® is particularly easy and can be achieved in two stages. The spigot can be installed at the same time as the water supply pipe work and wall panelling.

A Flushing kit (part number 5640) fits over the spigot such that, in accordance with Water Supply (water fitting) Regulations, pipe work flushing can be carried out as soon as water is available on site. This spigot mounted flushing kit also better facilitates the required thermal and chemical disinfection of the hot and cold water system before the tap body is connected to the spigot.

**Commissioning**

The OPTITHERM® tap assembly may be fitted to the spigot and commissioned during the final build phase. This greatly reduces the risk of damage or contamination to the tap, which is often sustained as plastering and painting etc. is carried out around the wash hand basin. In any case the OPTITHERM® can only be properly commissioned once hot water is available and this is very often only in the latter stages of the build programme.

We recommend the current commissioning instructions be followed including thermal disinfection of the tap's internal surfaces (detailed on page 8).
In order to achieve consistent and accurate performance over a maximised operational lifespan, the product should be designed in such a way that facilitates easy access for routine testing and maintenance.

**ACCESSIBILITY**

By virtue of the fact that the thermostatic control is integral to the tap, it is easily accessed by facilities management staff in possession of the correct tools and equipment (see accessories on page 11). The OPTITHERM® features integral isolation valves, which are accessible without moving the tap or any panelling, and are used when testing thermostatic control performance and safety.

**STRAINER**

Hot and cold strainer and check valve cartridges are accessible for routine cleaning – the strainer basket is removable to aid rinsing and disinfection.

**THERMOSTATIC CARTRIDGE**

The thermostatic cartridge is easily removed when due for repair or replacement (we recommend every 3 years).
TESTING AND SAMPLING
An additional Flushing Kit (part no. 5492) allows for routine water supply temperature testing and sampling for micro-biological analysis. We also recommend routine pipe work flushing at higher velocity, which shears excess biofilm from the pipe walls and removes it to drain - thus improving water quality.

THERMAL DISINFECTION
The OPTITHERM®'s Thermal Disinfection Adaptor (TDA) allows the thermal regime to be extended right down to the point of water discharge. The thermal image above shows how, during the disinfection process, the surface temperature of the tap increases to system temperature and in doing so its internal surfaces become sanitised.

A narrated animation illustrates fully the flushing and disinfection procedure using OPTITHERM® accessories listed on page 11.

The product should be so designed to facilitate best practice water system management with respect to microbiological contamination.
The OPTITHERM® can be installed with our unique dual levers or with short levers as required. The location of the point of discharge can be modified by the inclusion of extension pieces.

It is important that water does not fall directly into the plughole and the extension pieces give the designer and installer scope to make the OPTITHERM® ideally compatible with the selected wash hand basin.

Fixtures and fittings used by healthcare staff and patients should be designed wherever possible to contribute to enhanced infection control and perform in a manner that is conducive to maintaining excellent levels of hygiene.

The strip of images above are taken from the fully narrated 3D-animation which can be found at www.horne.co.uk/Products/Optitherm/

An additional Kit (part no. 6006) to aid compliance with respect to water quality comprises a Flushing/Sampling Kit and Thermal Disinfection Adaptor in a sturdy carrying case.

A special toolkit (part no. 5491) is available to aid maintenance of the OPTITHERM® tap and includes the following items (some pictured above):

- Multi-tool plus screwdriver bit
- 2 No. hex keys
- 1 no. Torx T20 key
- Strap wrench
- Thermostatic cartridge removal tool
- Flushing/Sampling kit
- Oil bottle
