

The hose retaining ring is specifically designed to fit Horne riser rails and restrict the reach of the handset when it is removed from its holder; helping to maintain an appropriate air gap above drains and other potential sources of contamination.

The retainer offers a flexible solution; it is adjustable to any height and fully removable where necessary for caregivers.

The need for, and position of, the retaining ring should be determined by operator risk assessment, taking into account hose length, outlet height, local installation factors, and the proximity of potential sources of contamination.

The hose should be directed through the retaining ring from below, and the retaining ring should be mounted to the left of the riser rail, when used as an accessory for Horne shower panels.
